SECTION ONE

Resource and Research Companion

What follows is a curated reference set organized by the protocol modules they support. Each resource is included because it strengthens something specific in the IOS-1 architecture. Engage with these selectively, when a particular module is live in your practice, not as prerequisite reading.

Foundational Researchers and Theorists

Stephen Porges | Polyvagal Theory

Field	Autonomic Neuroscience / Trauma
Core idea	Polyvagal Theory proposes an organizing hierarchy of ventral vagal social engagement, sympathetic mobilization, and dorsal vagal shutdown. The model is influential in clinical practice, and some anatomical and evolutionary claims remain scientifically debated. IOS-1 uses the three-state map as a practical recognition tool, not as a complete account of autonomic physiology.
Why it matters	The Somatic Anchor axis uses this model as one practical reference point. Reduced capacity, activation, or shutdown can constrain attention, reflection, and behavioral flexibility. This is why the protocol sequences regulation support before architecture.
Protocol support	Module 3 (Somatic Anchor Assessment), Module 8 (Installation Protocol), Module 2 (Masking Budget Baseline)
When to engage	Before or alongside Module 3. Especially useful if you are managing chronic illness, high masking load, or unpredictable capacity fluctuation.

Bruce McEwen | Allostatic Load Research

Field	Neuroendocrinology / Stress Biology
Core idea	Chronic stress can contribute to measurable cumulative physiological burden. Allostatic load describes the wear associated with repeated or dysregulated stress-response activation across body systems.
Why it matters	Supports the protocol's emphasis on structural adjustment rather than willpower-based override. Allostatic load is one evidence-informed model supporting the Masking Budget concept.
Protocol support	Module 2 (Masking Budget Baseline), Module 3 (Somatic Anchor), Module 6 (Systemic Load Map)
When to engage	When the Masking Budget assessment reveals consistent deficit. Grounds the data in physiology, not self-criticism.

Kimberle Crenshaw | Intersectionality Framework

Field	Legal Theory / Critical Identity Studies
Core idea	Identity pressures compound multiplicatively across structural dimensions. Intersecting positions produce unique burdens not visible when dimensions are analyzed separately.
Why it matters	Exercise 6.3 (Intersectional Pressure Mapping) is built on this framework. Without it, participants consistently underestimate structural masking load and attribute depletion to personal inadequacy.
Protocol support	Module 6 (Systemic Load Map), Module 2 (Masking Budget Baseline)
When to engage	During or after Module 6. Critical for participants operating under multiple structural pressures simultaneously.

Dan McAdams | Narrative Identity Theory

Field	Personality Psychology / Identity Research
Core idea	Identity is an internalized, evolving personal narrative in which the self functions as both narrator and protagonist. Nuclear episodes, moments of deliberate authorship, structure a coherent forward-oriented identity.
Why it matters	The theoretical foundation for the Narrative Filter work in Module 4, particularly Exercise 4.5 (Sovereign Turning Points).
Protocol support	Module 4 (Narrative Filter Audit), Module 10 (Quarterly Review)
When to engage	During Module 4 work and quarterly biographical integration review.

Michael White and David Epston | Narrative Therapy

Field	Psychotherapy / Clinical Practice
Core idea	The person is not the problem. Externalizing a problem separates it from identity, enabling deliberate authorship rather than problem-saturated self-concept.
Why it matters	Exercise 4.4 (Problem Externalization Protocol) applies this directly. Clarifies the distinction between a condition being navigated and a permanent characteristic.
Protocol support	Module 4 (Narrative Filter Audit)
When to engage	During Module 4, particularly when narrative statements are heavily fused with identity.

Rick Hanson | Positive Neuroplasticity Training

Field	Clinical Psychology / Neuroscience
Core idea	Hanson's Have-Enrich-Absorb sequence is a practice framework for sustaining attention to beneficial experiences rather than allowing them to pass unnoticed. Use it as an intentional attention practice. Do not treat a brief exercise as proof that a durable neural trait has been installed.
Why it matters	Exercise 8.3 applies this attention practice within the IOS-1 framework. Identity installation is treated here as a behavioral process supported by repeated evidence and practice, not as a belief-only exercise.
Protocol support	Module 8 (Installation Protocol)
When to engage	At the start of Part III. Read alongside the Installation Behaviors setup.

Resmaa Menakem | Racialized Trauma and Somatic Residue

Field	Somatic Therapy / Intergenerational Trauma
Core idea	Systemic and historical trauma can shape stress exposure, bodily responses, health, caregiving environments, and relational patterns across generations. Research on biological embedding and intergenerational effects is developing. In humans, no single biological transmission mechanism fully explains these effects.
Why it matters	Supports Exercise 6.3 by locating structural masking load within embodied, relational, historical, and environmental context. Particularly relevant when racialized or intergenerational dimensions are present.
Protocol support	Module 6 (Systemic Load Map), Module 3 (Somatic Anchor)
When to engage	Alongside Module 6, particularly when intersectional pressures include race, ethnicity, or cultural marginalization.

Books

The Polyvagal Theory in Therapy | Deb Dana

Core idea	A clinician-facing translation of Porges's polyvagal work into practical state-recognition and regulation practices. Use as a polyvagal-informed resource while keeping the scientific limitations of the model in view.
Why it matters	Module 3.5 (Post-Deployment Somatic Triage Protocol) cites Dana directly. The most practical entry point for understanding why the triage sequence is structured as it is.
Protocol support	Module 3

Core idea	A clinician-facing translation of Porges's polyvagal work into practical state-recognition and regulation practices. Use as a polyvagal-informed resource while keeping the scientific limitations of the model in view.
When to engage	When Module 3 reveals consistent dorsal vagal or sympathetic patterns with limited recovery tools available.

My Grandmother's Hands | Resmaa Menakem

Core idea	A perspective on somatic and racialized trauma, intergenerational patterns, and body-based practices for structural stress.
Why it matters	Deepens the intersectional pressure work in Exercise 6.3 with embodied and historical context. Fills a gap that purely cognitive frameworks leave open.
Protocol support	Module 6
When to engage	Optional. Particularly useful when the Module 6 map reveals significant structural or racialized masking load.

The Stories We Live By | Dan McAdams

Core idea	How personal mythology, the narrative we construct about our own life, shapes identity and behavior. Explores nuclear episodes as the architecture of self-concept.
Why it matters	Directly supports the Narrative Filter work and Sovereign Turning Points exercise. Makes the theoretical underpinning accessible without being academic.
Protocol support	Module 4
When to engage	During or after Module 4. Especially useful if the Narrative Archaeology exercise surfaced significant inherited narratives.

Hardwiring Happiness | Rick Hanson

Core idea	A practical guide to the Have-Enrich-Absorb sequence. Presents an approach to negative bias and deliberate attentional practice. Treat the sequence as a practice framework rather than a verified mechanism for identity installation.
Why it matters	Companion reading for Exercise 8.3. Makes the practice logic clear without requiring a neuroscience background.
Protocol support	Module 8
When to engage	At the start of the Installation Protocol phase.

Narrative Means to Therapeutic Ends | White and Epston

Core idea	The foundational clinical text for narrative therapy externalization and re-authoring practices.
Why it matters	For participants who want to go deeper on the Problem Externalization Protocol. Academic but accessible.
Protocol support	Module 4
When to engage	Optional. For those with clinical or academic interest in the narrative therapy framework.

Podcasts and Audio Resources**The Polyvagal Podcast | Deb Dana and Seth Porges**

Core idea	Accessible conversational exploration of polyvagal concepts, regulation tools, and clinical applications.
Why it matters	Best audio entry point for Module 3 concepts. Useful for low-capacity days when reading is not accessible.
Protocol support	Module 3
When to engage	During the seven-day capacity log period. Passive listening format is compatible with low bandwidth.

Unlocking Us | Brene Brown (selected episodes on shame and narrative)

Core idea	Research-based conversations on identity, vulnerability, and narrative construction. Relevant episodes include those on self-perception and inherited identity scripts.
Why it matters	Accessible support for Module 4 work, particularly for participants new to the concept of narrative authorship.
Protocol support	Module 4
When to engage	Optional. During or after Module 4 if the concept of narrative authorship requires more contextual grounding.

Hidden Brain | Shankar Vedantam (identity and behavior episodes)

Core idea	Research-backed conversations on behavioral psychology, identity, and cognitive patterns. Particularly relevant episodes cover identity-protective cognition and narrative bias.
Why it matters	Useful for grounding the Identity Backfire Effect and Narrative Filter concepts in accessible research.

Core idea	Research-backed conversations on behavioral psychology, identity, and cognitive patterns. Particularly relevant episodes cover identity-protective cognition and narrative bias.
Protocol support	Modules 4, 6, 9
When to engage	Between modules, as contextual enrichment rather than prerequisite preparation.

Research Domains for Further Reading

These are not required reading. They are research domains, clinical models, and theoretical frameworks that inform IOS-1. Participants with existing familiarity in these areas will recognize where the protocol applies established findings and where it uses a model as an organizing lens.

Research Domain	Protocol Application
Polyvagal Theory (Porges)	Somatic Anchor axis, capacity ratings, triage protocol
Allostatic Load Research (McEwen)	Masking budget, deficit identification
Narrative Identity Theory (McAdams)	Narrative Filter audit, sovereign turning points
Narrative Therapy (White and Epston)	Problem externalization, re-authoring
Intersectionality (Crenshaw)	Intersectional pressure mapping, structural load
Minority Stress Model (Meyer)	Structural masking requirements, capacity baseline
Positive Neuroplasticity (Hanson, Hebb)	Installation behaviors, neuroplasticity protocol
Self-Affirmation Theory (Steele)	Sovereign identity declaration, micro-voting
Metacognitive Accuracy (Flavell, Schraw)	Diagnostic verification protocol (Module 2A)
Habit Research (Clear, Fogg)	Thirty-day consistency tracker, micro-voting system
Self-Perception Theory (Bem)	Identity-behavior inference, installation architecture

SECTION TWO

Integration Exercises

These exercises are designed to deepen engagement with specific IOS-1 modules. They are not replacements for the protocol exercises. They are companions: practices to run alongside or after module completion.

Low-capacity adaptations are included throughout. Within the Distinct Character framework, use the adaptation when your Somatic Anchor is below 5. If you notice shutdown, cognitive fog, flat affect, or reduced access to sustained cognitive output, pause the exercise and come back to it. These signals are pacing data, not a diagnosis.

Part I Integration: The Inventory

Exercise I-A: The Energy Ledger (Module 1 Extension)

PURPOSE

Sharpen the Gives or Costs classification from Exercise 1.1 with behavioral evidence rather than felt sense alone.

METHOD

Select three identities from your Identity Scan: one you classified as Sustaining, one as Strategic Mask, and one as Inherited Performance.

For each, track the following across one week without changing your behavior:

- What is your capacity level at the start of each context where this identity activates?
- What is your capacity level within 30 minutes of operating from this identity?
- What does your body specifically do in each context (jaw, breath, shoulders, gut)?
- How long before you return to your pre-context capacity baseline?

Low-capacity adaptation: Track only one identity. Use a simple 1-5 scale instead of a 1-10 scale. Record a single word or body location instead of full observations.

Exercise I-B: The Installation Archaeology Question (Module 1 Deepening)

PURPOSE

Extend Exercise 1.4 to identify the relational network that reinforces each Inherited Performance currently.

REFLECTION PROMPT

For each Inherited Performance you identified:

- Who in your current life would be most disoriented if you released this performance?
- What do they need from you that this performance provides?
- Is providing that thing a sovereign choice or an inherited obligation?

These questions surface the current relational investment in keeping an Inherited Performance installed, which is distinct from its origin. Both matter for governance.

Exercise I-C: The Masking Economy Audit Log (Module 2 Extension)

PURPOSE

Build a two-week behavioral record of your actual masking load versus your anticipated masking load.

METHOD

Each morning, predict your masking load for the day using the cost rating system from Exercise 2.1 (1-5 per mask).

Each evening, record the actual load: which masks were deployed, for how long, and at what cost.

At the end of two weeks, compare predicted versus actual. Where are you consistently underestimating? What are you routinely not counting?

TRACKING QUESTIONS

- Which masks do you routinely forget to count until you are already in deficit?
- Which contexts produce higher mask cost than you anticipate?
- Is there a time of day when your masking capacity drops predictably?

Chronic illness adaptation: Focus only on your two highest-cost masks. Track in the evening only. A single sentence per mask per day is sufficient. Do not add a tracking system you will not maintain at low capacity.

Part II Integration: The Assessment

Exercise II-A: The Capacity Envelope in Practice (Module 3 Extension)

PURPOSE

Convert your Module 3 capacity data into a working governance tool rather than a completed exercise.

METHOD

Based on your seven-day capacity log, identify three specific conditions that consistently raise your capacity by 1-2 points and three that consistently lower it.

Condition Type	Specific Condition
Raises capacity	
Raises capacity	
Raises capacity	
Lowers capacity	
Lowers capacity	
Lowers capacity	

APPLICATION QUESTION

Looking at your week ahead: what conditions will you encounter that will lower your capacity? What is one adjustment you can make in advance to reduce the deficit before it occurs?

Low-capacity note: On days below a 4, this exercise reduces to one question only: what one thing can I remove or delay today to avoid operating further into deficit? Do not attempt the full mapping when your Somatic Anchor cannot fund it.

Exercise II-B: Autonomic State Recognition in Real Time (Module 3 Deepening)

P U R P O S E

Build the skill of reading your autonomic state mid-context, not just in retrospect.

M E T H O D

For one week, set a single reminder at a time that typically falls mid-task or mid-social interaction. When the reminder fires, pause for 30 seconds and identify:

- Which autonomic state am I likely in right now? (Ventral vagal, sympathetic, dorsal)
- What is the specific physical indicator that tells me? (Breath quality, jaw tension, focus quality)
- What was I doing when this state set in?

Do not attempt to change the state. The goal at this stage is recognition accuracy, not regulation performance.

Exercise II-C: Narrative Thread Mapping (Module 4 Extension)

P U R P O S E

Identify the through-line connecting your most significant inherited narratives.

R E F L E C T I O N P R O M P T

Review your Exercise 4.1 responses. Across all the statements you wrote, identify the single organizing belief they share. The through-line is usually a statement about what kind of person you are, what you are permitted to have, or what happens to people like you.

Write that through-line statement plainly.

Then answer:

- If this belief is the operating system, what behaviors does it generate automatically?
- Which of those behaviors are costing you something you have not named directly yet?
- What would the revised through-line be, grounded in actual evidence from your Sovereign Turning Points?

Exercise II-D: The Standards Pressure Test (Module 5 Extension)

P U R P O S E

Test whether your identity standards hold under actual pressure, not just in reflection.

M E T H O D

Select one identity standard you revised in Exercise 5.3. Over the following week, identify at least three moments where that standard was tested by a social interaction, a demand, or an internal pressure.

For each moment, record:

- What happened and what the pressure was
- Whether you operated from the original inherited standard or the revised sovereign one
- What the gap between them cost or produced

This is behavioral data, not self-judgment. The purpose is to identify where the revised standard needs behavioral reinforcement versus where it is already operating.

Part III Integration: The Architecture

Exercise III-A: Backfire Preparation Rehearsal (Module 6 Extension)

PURPOSE

Make the Identity Backfire preparation from Exercise 6.2 active before you need it, not only after it occurs.

METHOD

Take the three high-backfire contexts you identified. For each, write out your prepared response in plain, spoken language as if you were saying it aloud. Then say it aloud. Once. The physical experience of articulating the response in advance changes how it lands under actual pressure.

Note: This is not performance rehearsal. The goal is familiarity with your own position, not scripted delivery. Participants who have never said their boundary aloud often discover, in the moment of pressure, that they do not have access to it.

Low-capacity adaptation: Focus on one context only. Write three sentences maximum. Practice it once in a low-demand moment. That is sufficient to build familiarity with your own position.

Exercise III-B: Identity Complexity Audit (Module 7 Extension)

PURPOSE

Verify that the identity complexity commitments from Exercise 7.2 are genuinely non-overlapping and investable at your current capacity level.

REFLECTION PROMPTS

- If your highest-salience identity were unavailable for 90 days, which of your complexity commitments would you actually activate? Be honest about which ones are nominal.
- Which commitment has the clearest behavioral foothold in your current life?
- What is one specific, schedulable action that would invest in the commitment that has the least traction right now?

Exercise III-C: Installation Behavior Environmental Mapping

PURPOSE

Identify the environmental conditions that support or undermine each Installation Behavior from Exercise 8.1.

METHOD

For each of your Installation Behaviors, map the environment:

Mapping Question	Your Response
Where does this behavior happen most reliably?	
What conditions need to be present for execution?	
What conditions reliably prevent execution?	
What is the simplest environmental change that increases execution probability?	
What is the smallest acceptable version of this behavior on a low-capacity day?	

Exercise III-D: The Micro-Vote Review (Module 8 Weekly)

PURPOSE

A structured weekly review of behavioral evidence, not performance evaluation.

WEEKLY QUESTIONS

- How many votes did I cast this week toward the identity I am installing?
- Where was execution absent? What was the governing condition: low capacity, environmental friction, or something else?
- Where was execution present that I did not expect? What made it possible?
- What is the one behavioral adjustment that would increase vote frequency next week?

Chronic illness adaptation: On weeks where baseline capacity was compromised, count the minimum viable version of each behavior as a vote. The threshold for a vote is not peak performance. It is deliberate, intentional execution at whatever level your Somatic Anchor could fund.

Part IV Integration: The Governance

Exercise IV-A: The Weekly Audit Accelerator

PURPOSE

A condensed version of the weekly audit for low-capacity or high-demand weeks. This does not replace the full audit. It holds the governance structure when the full audit is not accessible.

Three questions. One sitting. No more than ten minutes. 1. Where did I operate from a Sustaining Role this week, and where did I operate from a mask I did not consciously choose to deploy? 2. Was my masking load within what my Somatic Anchor could fund, or did I operate in deficit? What was the cost? 3. One specific thing I will do differently next week to reduce deficit or strengthen the identity I am building.

Exercise IV-B: The Quarterly Architecture Question

PURPOSE

A single reflective prompt to use before the quarterly review when capacity is limited but the governance check-in is overdue.

If the identity I am installing had a current progress assessment, what would it say? Where is it showing up in my behavior consistently? Where is it still inconsistent? And what single structural condition is producing the inconsistency?

SECTION THREE

Quick Reference Guide

This guide is designed for fatigue, overwhelm, cognitive load, and any moment when the full protocol is not accessible but governance still needs to operate. Use it as a fast-access participant support sheet.

Core Distinctions

Term	Operational Definition
Sustaining Role	Generates energy. No meaningful recovery required after deployment.
Strategic Mask	Costs energy. Legitimate purpose. Requires recovery after sustained deployment.
Inherited Performance	Installed before you had the sovereignty to evaluate or refuse it. Often feels like simply who I am.
Somatic Anchor	Your body's available capacity right now. Not a fixed number. A current physiological state.
Narrative Filter	The mechanism converting experience into self-account. Always operating. Usually inherited.
Systemic Load	Pressures from outside: relational, institutional, structural. Includes what you have not named as pressure because it is normalized.
Identity Deficit	When masking load exceeds somatic capacity. Not a character flaw. A structural condition.
Identity Backfire Effect	Social corrective pressure when the system encounters unexpected identity change. It does not mean the change is wrong.
Governance Criterion	The installed standard by which external influence is evaluated before being incorporated.

Sequence Reminders

The Protocol Sequence Cannot Be Reversed

Regulation before architecture. Inventory before assessment. Assessment before construction. Installation before governance.

Skipping ahead produces partial work. Identity built on an imprecise inventory is structurally compromised before the first governance decision.

Warning Signs

Stop and recalibrate when you notice any of the following:

Warning Sign	What It Likely Indicates
Cognitive fog or flat affect during inventory work	Possible shutdown or reduced-capacity signal. Return to Phase 1 regulation support before continuing.
Producing answers that sound right rather than accurate	Performance mode has replaced diagnostic mode. The Diagnostic Verification Protocol exists for exactly this.
Masking load feels manageable but capacity keeps dropping	You are underestimating structural load. Revisit Exercise 6.3 (Intersectional Pressure Mapping).
Installation Behaviors are scheduled but rarely executed	Environmental friction is the likely cause, not motivation. Revisit Exercise III-C (Environmental Mapping).
Narrative revision feels forced or aspirationally inflated	Revisions grounded in evidence carry a different quality than those grounded in aspiration. Return to Exercise 4.5 (Sovereign Turning Points) for evidence before revising.
Identity Backfire pressure is causing you to stall the work	Expected. The system is doing what systems do. Return to Exercise 6.2 (Backfire Preparation) and work with what you prepared.
Weekly audits are being skipped consistently	The governance structure is not yet habit. Simplify using the Three-Question Accelerator (Section Two, Exercise IV-A).
Quarterly review reveals Inherited Performances re-establishing	Normal. They re-establish under stress. The review exists to catch this. Identify the condition that allowed re-establishment, not the re-establishment itself.

Common Mistakes

- Classifying difficult identities as Sustaining Roles to avoid examining them. The Diagnostic Verification Protocol catches this, but only if you score honestly.
- Completing the protocol in a single sitting. The protocol specifies rest periods between parts to support pacing, attention, and capacity, not aesthetics.
- Rating masking costs aspirationally rather than accurately. Understated cost ratings produce understated deficit assessments and inaccurate governance decisions.
- Treating the Narrative Filter revision as an affirmation exercise. Revised narratives must be grounded in evidence. An inflated reframe is a different form of narrative distortion.
- Installing Installation Behaviors that are too abstract to track. If you cannot answer in 10 seconds whether you executed the behavior on a given day, it is not specific enough.
- Skipping the Dorsal Warning note after Module 1. A drop in energy, cognitive clarity, or emotional access after releasing an Inherited Performance may indicate shutdown, depletion, or a stress-response shift. Treat the change as pacing data. Pause and return to Phase 1 regulation support before continuing.
- Treating the Governance section as a one-time completion rather than a standing practice. The architecture degrades without active stewardship.

Troubleshooting Prompts

When you are stuck on an exercise

Situation	Prompt
Cannot identify your Inherited Performances	Ask: which roles do I perform automatically, without examining whether I chose them? What would people around you say if you stopped performing this role?
Cannot rate your masking cost accurately	Track the recovery time after the context ends. Within the Distinct Character scoring framework, if it takes more than 20 minutes to feel functional again, rate the cost at least a 3. This is a governance rule, not a clinical measurement standard.
Narrative revision feels empty	Return to Exercise 4.5. The sovereign narrative must be built on actual evidence. If the evidence is thin, build more of it through Installation Behaviors before revising the narrative.
Cannot identify Installation Behaviors	Start smaller. What is the minimum behavioral unit of this identity that you could execute reliably at a 4 out of 10 capacity? That is your behavior.
Weekly audit feels repetitive without progress	The audit is not a progress report. It is a governance practice. Repetition is the point. Look at the pattern across four weeks, not the content of any one week.

Low-Energy Practice Options

These are not workarounds. They are calibrated versions of the governance practice matched to available somatic capacity.

Full Practice	Low-Energy Version
Seven-day capacity log (Exercise 3.2)	Three-day log with one-word observations only. No full sentences required.
Weekly audit (Module 9)	Three-question accelerator from Section Two. No more than ten minutes.
Positive Neuroplasticity Protocol (Exercise 8.3)	The Enrich step alone: pause for 15 seconds and notice one thing in the body. That is sufficient to begin the deliberate attention practice.
Installation Behavior execution	Execute the minimum viable version of the behavior. Count it as a vote. Identity is installed through accumulated behavioral evidence, not peak performance.
Quarterly review (Module 10)	One question only: what single structural adjustment does the architecture need this quarter? Write one paragraph. Schedule the full review for when capacity is higher.
Backfire Preparation (Exercise 6.2)	Read your prepared responses aloud once. That is sufficient to refresh familiarity with the position you set when you wrote them.

Simplified Deployment Guidance

Before any identity deployment in a high-cost context:

Check your Somatic Anchor level.

Name the mask or identity you are about to deploy.

Confirm its purpose is still active.

Confirm your capacity can fund it without putting you in deficit for the rest of the day.

After any high-cost deployment:

Use the Sovereign Anchor Reset (physical threshold, I Am statement, five-minute transition).

If capacity is below 4, deploy the Somatic Triage Protocol before the next demand. Not after.

SECTION FOUR

Optional Deepening Paths

These are directions for participants who want to extend their understanding beyond what IOS-1 covers. None of these are required. They are offered as optional intellectual and developmental territory for participants who find the framework useful and want to understand its theoretical architecture more completely.

These paths are positioned as independent learning, not protocol prerequisites. Engaging with them will enrich your use of the protocol. Not engaging with them will not compromise it.

Path 1: The Neuroscience of Identity

This path deepens understanding of why the Somatic Anchor axis functions as it does and why nervous system state governs identity availability.

Resource	Angle
The Polyvagal Theory (Porges, 2011)	Original academic text. Dense but precise. Best for participants with clinical or research background.
Befriending Your Nervous System (Deb Dana)	Accessible guided format. Strong on practical application of polyvagal concepts.
Why Zebras Don't Get Ulcers (Robert Sapolsky)	Stress physiology and allostatic load explained without clinical jargon. Fills in the McEwen framework used in Module 3.
Waking the Tiger (Peter Levine)	Somatic experiencing approach to nervous system regulation. Complements the triage protocol with deeper body-based tools.

Path 2: Narrative Identity and Self-Authorship

This path extends the Module 4 Narrative Filter work into deeper theoretical and clinical territory.

Resource	Angle
The Redemptive Self (Dan McAdams, 2006)	Research on how Americans construct redemptive personal narratives. Relevant for understanding dominant cultural narrative templates.
Maps of Narrative Practice (Michael White, 2007)	Advanced narrative therapy text. For participants interested in applying re-authoring frameworks beyond personal use.
Man's Search for Meaning (Viktor Frankl)	Foundational text on meaning-making and narrative authorship under extreme constraint. Provides philosophical grounding for the Sovereign Turning Points exercise.

Resource	Angle
Narrative Therapy: The Social Construction of Preferred Realities (Freedman and Combs)	Clinical application text. Useful if you are a practitioner who works with clients and wants to apply IOS-1 narrative tools in that context.

Path 3: Structural and Intersectional Analysis

This path deepens the Module 6 Systemic Load and Intersectional Pressure Mapping work.

Resource	Angle
Mapping the Margins (Kimberle Crenshaw, 1991)	The original academic paper. Foundational and precise. Available publicly through legal scholarship archives.
My Grandmother's Hands (Resmaa Menakem)	Somatic and structural. Bridges the body-based work in Module 3 with the structural analysis in Module 6.
The Body Keeps the Score (Bessel van der Kolk)	Influential trauma-focused text. Relevant to the somatic residue concept and the embodied cost of structural masking. Use as contextual reading, not as a standalone research review.
Minority Stress and Mental Health in Gay Men (Ilan Meyer, 1995)	Original research on chronic stressors produced by stigmatized social positions. Theoretical foundation for structural masking cost calculations.

Path 4: Behavior, Habit, and Identity Installation

This path deepens the Module 8 Installation Protocol and the neuroplasticity architecture underlying it.

Resource	Angle
Atomic Habits (James Clear, 2018)	Practical behavioral architecture. The micro-voting concept in Exercise 8.4 is directly informed by this work. Best read alongside Module 8.
Tiny Habits (BJ Fogg, 2019)	Behavior design methodology. Relevant to the environmental mapping component of Installation Behaviors.
Hardwiring Happiness (Rick Hanson, 2013)	The Have-Enrich-Absorb sequence explained fully. Companion reading for Exercise 8.3.
The Power of Habit (Charles Duhigg, 2012)	Accessible overview of habit loop research. Useful contextual grounding before beginning the thirty-day consistency tracker.

Path 5: Metacognition and Self-Assessment Accuracy

This path deepens the theoretical basis for the Diagnostic Verification Protocol in Module 2A.

Resource	Angle
Metacognition: An Introduction (Flavell, 1979)	Original academic paper. The theoretical anchor for why the Diagnostic Verification Protocol exists.
Thinking, Fast and Slow (Daniel Kahneman, 2011)	System 1 versus System 2 thinking. Explains why self-assessment during emotionally charged inventory work requires structural verification.
Insight (Tasha Eurich, 2017)	Research on why most people's self-assessments are less accurate than they believe, and what structural conditions improve them.

Path 6: The Companion Protocols in This Series

IOS-1 establishes the foundation. The following protocols in the Distinct Character Self-Mastery Series extend the framework into the depth work that IOS-1 introduces.

Protocol	Function
MES-1: The Masking Economy System	Full governance of the masking economy. Deep work on mask cost, recovery, and structural masking load. Extends Modules 2 and 6.
NCS-1: Narrative Control System	Complete narrative filter audit and re-authoring protocol. Clinical-adjacent application of narrative therapy-informed tools. Extends Module 4.
SBP: Somatic Baseline Protocol	The Phase 1 prerequisite. Full somatic regulation architecture. The nervous system work that precedes IOS-1 identity work.
